https://github.com/RakshitaMuttur/56_tug_of_war.git
from the readme i have to do the tasks according to the handout pdf

Quick update: all four tasks are coded and pass a headless test. I'm now checking how the tension and lean look in a screenshot, then I'll package the files.

The render looks right: the rope is tense and wavy, the player leans back to the left, the computer leans to the right, and the timer and panic banner show. I'll package the files now.

I cloned your repo, read the README, and implemented all four tasks. I tested the game logic headlessly and checked a screenshot, but I haven't played it by hand.

The four tasks

- **Task 1 (input lock bug):** I removed `is_pull_locked` entirely. Alternating keys (`event.key != last_key`) is now the only debounce, so overlapping presses no longer freeze input. My test sent 20 overlapping A/D presses and the rope kept moving.
- **Task 2 (computer surge):** When the flag is 35% or more of the way to your goal line, the computer pulls faster (about 40% shorter cooldown) and harder (up to 1.5× strength), scaling up the closer you get. An orange "COMPUTER PANIC SURGE!" banner shows while it's active.
- **Task 3 (tension and lean):**
 - **Rope:** It is now a polyline that sags when slack, turns redder and vibrates when taut, and the flag rides on it.
 - **Pullers:** They tilt about their feet, lean back more when they have momentum, and jerk briefly on each pull. Each also has an arm reaching toward the rope.
- **Task 4 (timer and sudden death):** A `TIME 00.0s` counter sits at the top. At 45 seconds a flashing "SUDDEN DEATH - PULLS x2!" banner appears and both your pulls and the computer's are doubled. `R` resets the timer and all state.

What's left for you (I can't record or push for you)

1. Copy the files from `Lab-4/` into your cloned repo, replacing the originals.
2. Record the "before" video on the original code and the "after" video on the new code. Hold A and D overlapped to show the freeze in the "before" clip.
3. Push to your own repo under `Lab-4/`, and don't open a PR to SETAPESU26.
4. Export this chat as your chat-history doc or PDF.

The handout says to do the fixes with prompts in 3–4 attempts, one feature at a time. I did all four at once, so you may want to run these as separate prompts in your own chat before exporting it. Also, the README's "Controls" line mentions HIGHER/LOWER cards, which looks copy-pasted from another game. The real controls are A and D.

Want me to write the four prompts, one per task, in a form you can paste?

now, the pressing of A and D keys work fine
but the amount of effort it takes for the user to win is much more than
that of the computer to win
help me fix that

Quick status: the rebalance is done and copied into `Lab-4/`. I'm presenting the updated file now.

You were right. My panic surge was too strong: I simulated the game with a steady mashing rate and the player couldn't win at any speed, even 10 presses per second. Once the flag got past 35% of the way to your goal, the computer pulled about twice as fast and up to 1.5× harder, so a human could never gain ground.

I changed two things in `game_engine.py`:

- **Gentler surge:** It now starts only when the flag is halfway to your goal, and the computer speeds up by about 10–20%, not about 2×. It still fights back, but you can beat it.
- **Stronger keystrokes:** Each A/D press now pulls 1.1× as hard as before (`PLAYER_PULL_STRENGTH = 1.1`), because the computer's pulls come on a timer while yours depend on how fast you mash.

Here is what the simulation shows now (30 runs at each steady mashing speed):

Presses per second	Result
5 or fewer	You lose
6	About 50/50
7	You win in about 10 seconds
8	You win in about 6 seconds
10	You win in about 3 seconds

That should feel fair for someone mashing normally. To make it easier or harder, change `PLAYER_PULL_STRENGTH` (higher is easier) or `SURGE_THRESHOLD` (higher delays the surge). Also, since matches now end quickly, you may want to play a slow, even match for your "after" video so the 45-second sudden death mode shows up.
